

reacting to said mobile station having IP capability by

initiating at said access node a selection of a macro mobility entity for said mobile station, and

sending the identity of said selected macro mobility entity to said mobile station in association with an access context establishment.

2. (Amended) A method according to claim 1, comprising sending to said mobile station a request to initiate activation of a packet protocol context for said mobile station in said access system.

3. (Amended) A method according to claim 1, comprising checking at said access node, in response to said initiation of the attach procedure, whether said mobile station has macro mobility capability.

4. (Amended) A method according to claim 1, comprising sending the identity of said selected mobility entity to said mobile station in said request.

5. (Amended) A method according to claim 1, comprising initiating an activation of the packet protocol context by said mobile station having an associated mobile node in order set up a connection to said selected mobility entity, if a registration according to the macro mobility management is desired.

6. (Amended) A method according to claim 1, comprising said macro mobility management being Mobile IP type mobility management, and sending an agent advertisement message from said selected mobility agent to said mobile node over said connection, said agent advertisement message enabling said mobile node to initiate Mobile IP registration.

7. (Amended) A method according to claim 1, comprising checking said macro mobility capability of said mobile station on the basis of subscriber data stored in a subscriber data base or information provided by said mobile station in said attach procedure.

8. (Amended) A method according to claim 7, wherein said macro mobility capability is indicated by a classmark information of said mobile station.

9. (Amended) A method according to claim 1 or 7, wherein selected mobility entity is a foreign agent associated with one of said gateway nodes in said packet access network.

10. (Amended) A method according to claim 1 or 7, wherein said identity includes a mobile entity address.

11. (Amended) A method according to claim 1 or 7, wherein the access system is a radio system, such as GPRS or UMTS.

12. (Amended) A packet access system, comprising
a plurality of mobile stations, at least some of said mobile stations supporting macro layer mobility,
access nodes,
at least one mobility entity arranged to provide macro mobility management services, said access nodes being responsive to said mobile station having the macro mobility capability to
initiate a selection of a macro mobility entity for said mobile station, and
send an identity of said selected macro mobility entity to said mobile station.

13. (Amended) A system according to claim 12, wherein said access nodes are responsive to said mobile station having the macro mobility capability to initiate activation of a packet protocol context for said mobile station in said access system.

14. (Amended) A system according to claim 12 or 13, wherein said access nodes are responsive to an attach request received from a mobile station to check whether the mobile station has macro mobility capability.

15. (Amended) A system according to claim 12, wherein said access node sends the identity of said selected mobility entity to said mobile station in said request.

16. (Amended) A system according to claim 12, wherein said mobile station, when having an associated mobile node and desiring a macro mobility registration, is arranged to

initiate activation of the packet protocol context in order set up a connection to said selected mobility entity according to said identity.

17. (Amended) A system according to claim 12, wherein said access nodes are arranged to check said macro mobility capability of said mobile station on the basis of subscriber data stored in a subscriber data base or information provided by said mobile station in said attach procedure.

A2
18. (Amended) An access node for a packet access system comprising a plurality of mobile stations, at least some of said mobile stations supporting macro mobility, access nodes serving said mobile stations within respective parts of the packet access system, and at least two macro mobility entities being arranged to provide macro mobility management services to the mobile stations while registered to the access system, said access node comprising means, responsive to said mobile station having the macro mobility capability, for selecting at said access node a macro mobility entity for said mobile station, and for sending an identity of said selected macro mobility entity to said mobile station in association with an access context establishment.

19. (Amended) An access node according to claim 18, comprising means for checking whether a mobile station accessing the system via said access node has macro mobility capability.

A3
20. (New) A system according to claim 12, wherein said macro layer mobility is Mobile Internet Protocol.

See the attached Appendix for changes to effect the above claims.
